Microdermabrasion and Dermaplaning Consent Form

Diamondtome Microdermabrasion uses a diamond encrusted wand to remove superficial layers of the skin in the areas treated. The intensity of the procedure can be adjusted to your desired results and comfort level. Microdermabrasion is often used to treat some forms of acne, reduce the appearance of scars, wrinkles, hyperpigmentation and other skin conditions. A series of treatments is recommended for maximum results.

Dermaplaning uses a surgical blade to gently exfoliate the outer layer of dead skin cells and to remove fine facial hair, commonly known as “peach fuzz.” This procedure produces an immediately more radiant appearance. Following this treatment, makeup application is smoother and skin care products penetrate deeper, making them more effective. A series of treatments is recommended for maximum results.

Due to the contours of the face, certain areas, such as the eyelids and nose are not treatable using this method.

Possible side effects of the treatment area may include: mild redness of the skin, irritation and dryness. Minor superficial abrasions, as well as nicks to the skin can occur due to the shard surgical blade. The hair is expected to grow back blunt ended. New hair will not appear darker or denser. However, I do understand that any hormonal imbalance that may be present within my anatomical system can alter normal hair growth pattern.

Your fresh, newly exposed skin will be delicate. It is important that you use a mild basic cleaner and keep the skin well moisturized particularly around the delicate eye area. You should use a full spectrum sunblock of SPF 30 daily, and tanning beds should never be used. You are making an investment in your skin; it is to your benefit to protect it long after your treatment is finished.

Avoid the use of Retin-A, Renova, Alpha or Beta Hydroxy Acid products and all forms of scrubs for 48 hours post treatment. Avoid swimming pools for approximately 1 week. Anytime the skin barrier is broken, there is a small risk of bacterial or viral infection.

Contraindications Include: Active Acne, Active infection of any type such as herpes simplex or flat warts, any raised lesions, any recent chemical peels, chemotherapy or radiation, eczema or dermatitis, family history or hypertrophic scarring or keloid formation. Hemophilia, hormonal therapy that produces thick pigmentation, moles, oral blood thinners, pregnancy, recent use of topical agents such as glycolic acids, Retin-A or Hydroxy Acids, rosacea, scleroderma, skin cancer, sunburn, tattoos, uncontrolled diabetes, use of Accutane within the last year or vascular lesions.

The majority of clients receive noticeable, satisfactory to above average results with a series of treatments and a commitment to a daily skin care regimen. However, this outcome cannot be guaranteed as maximum results are highly dependent on age, cumulative sun exposure, health, lifestyle, genetic traits, general skin condition and willingness to follow recommended protocols.

I understand that no guarantee has been given to me regarding the condition of my skin or the percentage of improvement expected following treatment. My signature below acknowledges that I have read and understand the foregoing informed consent and agree to the treatment with its associated risks.
